

Redesigning the IT Department

And The Evolving Roles of Security

Jonathan Borgesen
Client Security Principle

Silo

“an isolated grouping, department, etc. that functions apart from others especially in a way seen as **hindering communication and cooperation.**”

IT Has Been Siloed For Too Long

The blame game needs to stop

What is the impact?

Of CIOs say IT's ability to maximize value for the business is hindered by challenges such as:

49%

IT and business teams
working in silos

49%

Limited visibility and data
into users' perspectives on
how digital services are
performing

36%

Limited visibility into the
business value that results
from changes to digital

IT objectives have changed

Digital Transformation

Pandemic driven cloud growth

Cloud Risk

68%

Misconfiguration of
cloud platform / wrong
setup

58%

Unauthorized access

52%

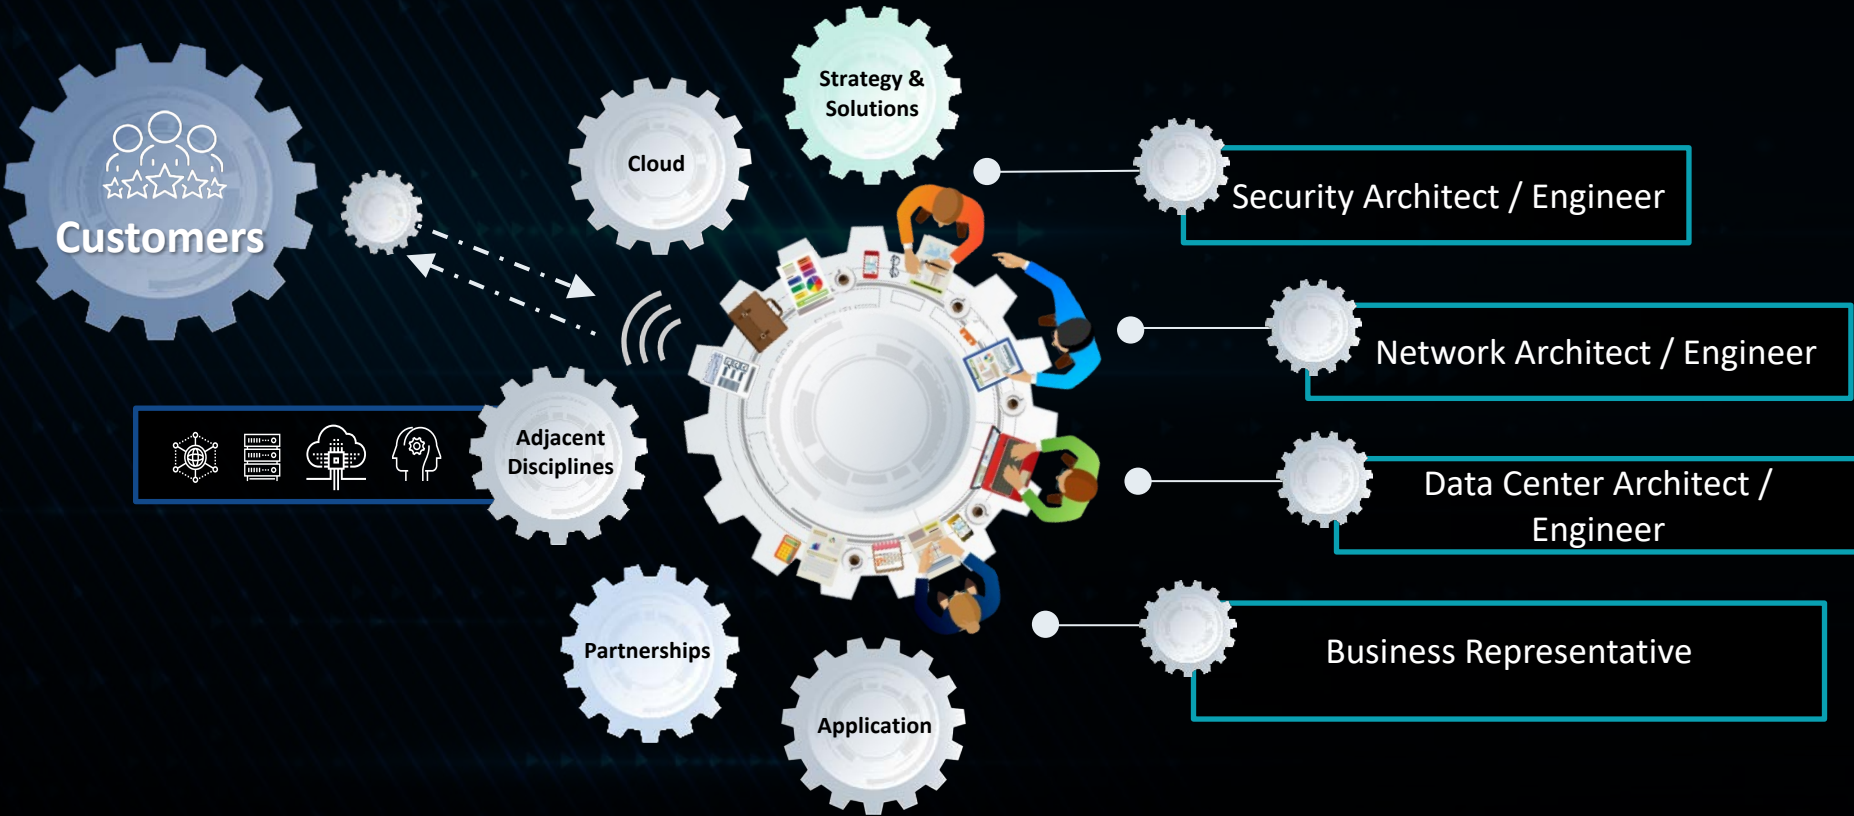

Insecure interfaces /
APIs

How Security Needs to Adapt

Modern IT

Functional Model

Step 1 – Understanding

What People?

Step 2 – How to Implement

Short staffed

- Tiger team – Create a group with representatives from the Business, Security, Networking, Data Center, and Cloud teams.

Managed Services

- Offset tasks – Managed services growth has exploded over the past three years due to their ability to assist organizations in doing more with less.

Consulting Services

- Bring in outside resources allocated for time that meets your requirements.

New Security Roles

Security Architect - Security engineers need to master their field and pursue depth of knowledge. Whereas **security architects need to stay focused across a broader range of domains** to fully understand the evolving threat and to acknowledge the emerging technologies required to protect organizations.

New Security Roles

DevSecOps – This is a trending practice in application security (AppSec) that involves introducing security earlier in the software development life cycle (SDLC). It expands the collaboration between development and operations teams to integrate security teams into the software delivery cycle.

New Security Roles

SecDevOps - Also known as rugged DevOps, SecDevOps is a set of best practices used to insert secure coding deep inside the DevOps development and deployment processes. It gets developers to think more about security principles and standards as they build their applications.

IT Needs to Modernize With The Business

The logo features the text 'e+ SECURITY' in white. The 'e' is a stylized, lowercase cursive font. The '+' is a small, simple plus sign. 'SECURITY' is in a clean, uppercase, sans-serif font. The text is centered within a large, semi-transparent blue circle that has a subtle, glowing digital pattern. The background is dark blue with faint, glowing lines and dots, suggesting a network or data flow.
